CLAIMS

We claim:

- 1. A method of classifying an activity state of a driver comprising: providing an at least two-state activity classifier; receiving sensor data relating to at least one vehicle operating condition; and classifying the driver activity into one of at least two states based upon the sensor data, a first of the at least two states corresponding to a maneuver activity and a second of the at least two states corresponding to a non-maneuver activity.
- 2. The method of claim I wherein the classifying the driver activity into the first of the at least two states corresponding to the maneuver activity further comprises:

classifying the state of the driver activity as maneuver when engaged in an activity corresponding to one of a change in the position of a vehicle with respect to one or more vehicles or stationary objects, a parking maneuver, a freeway ingress, a freeway egress, a communication with an external party, an interaction with another occupant and a state of an entertainment device.

3. The method of claim 1 wherein the classifying the driver activity into the second of the at least two states corresponding to the non-maneuver activity further comprises:

classifying the state of the driver activity as non-maneuver when disengaged from an activity corresponding to one of a change in the position of a vehicle with respect to a one or more vehicles or stationary objects, a parking maneuver, a freeway ingress, a freeway egress, a communication with an external party, an interaction with another occupant, and a state of an entertainment device.

- 4. The method of claim 1 further comprising:
 receiving a second sensor data relating to at least one of a condition of the
 driver, a condition of a passenger compartment, and a condition of a passenger.
- 5. The method of claim 1 wherein classifying the driver activity further comprises analyzing a position and a rate of change of the position of one of an

accelerator, a brake, a steering device, a turn signal selector, a clutch and a gear selector.

- 6. The method of claim 1 wherein the classifying the driver activity state further comprises classifying the driver activity state using one of instantaneous sensor data and prior sensor data.
- 7. The method of claim 1 wherein the classifying the driver activity state further comprises classifying the driver activity state using one of a linear function the sensor data and a non-linear function of the sensor data.
- 8. The method of claim 1, wherein the classifying the driver activity comprises classifying the driver activity using a statistical classifier.
- 9. The method of claim 8 wherein the classifying the driver activity using the statistical classifier further comprises using a C4.5, a RIPPER and a Quadratic classifier.
- 10. The method of claim 1 further comprising: altering the presentation of an event in the vehicle when the classifying the activity state of the driver is maneuver.
- 11. The method of claim 10 wherein the event is one of a wireless communication, a vehicle condition alert, a navigation instruction, an email message, and an entertainment presentation.

12. A two-state classification apparatus for classifying an activity state of a driver comprising:

an input for receiving sensor data relating to at least one vehicle condition; and a processor coupled to the input, wherein the processor analyzes the sensor data to determine a classification of the activity state of the driver into one of a maneuver and non-maneuver.

- 13. The classification apparatus of claim 12 further comprising an output for conveying a signal relating to the classification of the activity state of the driver.
- 14. The classification apparatus of claim 12 wherein processor implements the classification of the activity state of the driver using a statistical classifier.
- 15. The classification apparatus of claim 14 wherein the statistical classifier is one of a C4.5, a RIPPER and a Quadratic classifier.
- 16. The classification apparatus of claim 12 wherein the classification of nonmaneuver enables an event in the vehicle.
- 17. The classification apparatus of claim 12 wherein the classification of maneuver delays an event in the vehicle.
- 18. The classification apparatus of claim 17 wherein the event is a notification of a change in state of an other apparatus in the vehicle.
- 19. The classification apparatus of claim 12 wherein the sensor data corresponds to one of an instrumentation data, a vehicle control data, a driver condition data, and a driver activity data.
- 20. The classification apparatus of claim 12 wherein the processor analyzes the sensor data corresponding to a driver identification.

- 21. The classification apparatus of claim 12 wherein the at least one vehicle condition is one of a vehicle mechanical condition, a vehicle passenger compartment condition, a driver state and a passenger state.
- 22. The classification apparatus of claim 12 wherein the at least one vehicle condition is one of an accelerator pedal position, a brake pedal position, a vehicle speed, a turn signal state, and a steering wheel position.
- 23. The classification apparatus of claim 12 wherein the classification corresponds to a current condition of the sensor data.
- 24. The classification apparatus of claim 12 wherein the classification corresponds to a past condition of the sensor data.

25. A vehicle arranged and constructed to use a classification of an activity state of a driver comprising:

a classification apparatus for providing a signal corresponding to one of maneuver and non-maneuver, the signal based on a sensor data related to at least one operational condition; and

a device operable to use the signal for determining a timing for notifying the driver of an event.

- 26. The vehicle of claim 25 wherein when the signal corresponds to non-maneuver and the timing is immediate for notifying the driver of the event.
- 27. The vehicle of claim 25 wherein when the signal corresponds to maneuver and the timing is delayed for notifying the driver of the event.
- 28. The vehicle of claim 25 wherein the device is a wireless communication device.
- 29. The vehicle of claim 25 wherein the operational condition is one of a instrumentation condition, a vehicle control condition, an entertainment device condition, a driver condition, and a driver activity condition.
